

## Removing and installing main drive toothed belt

### Special tools and workshop equipment required

- ◆ Locking pin -T10074-

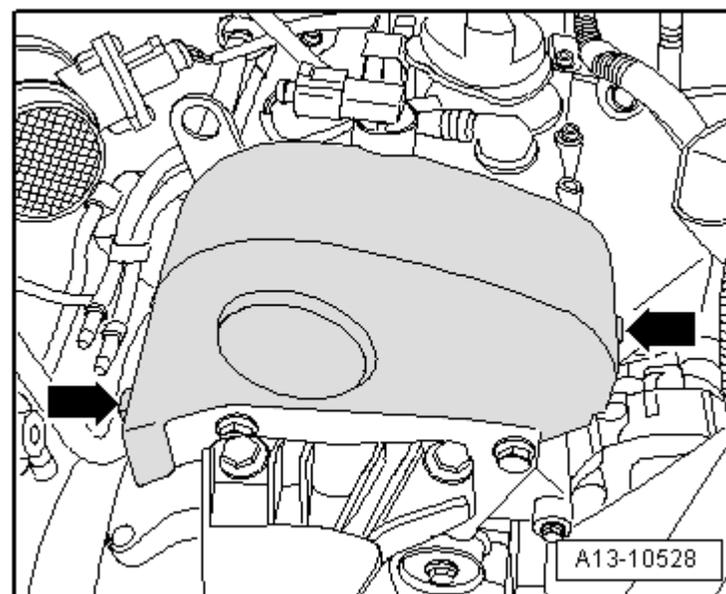

- ◆ Locating flange -T10110-

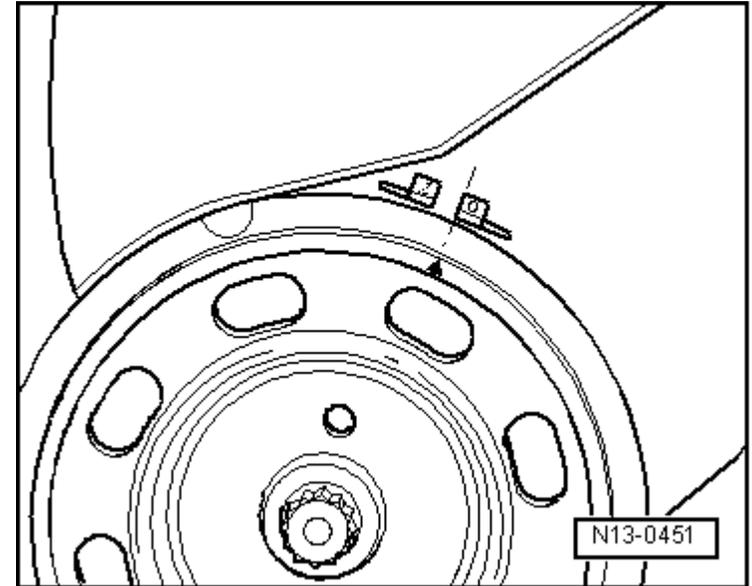

### Removing

- Detach bonnet → Chapter.
- Remove poly V-belt → Chapter.
- Release retaining clips -arrows- and detach cover (top) for toothed belt.

- Rotate crankshaft in normal direction of rotation to „TDC“.

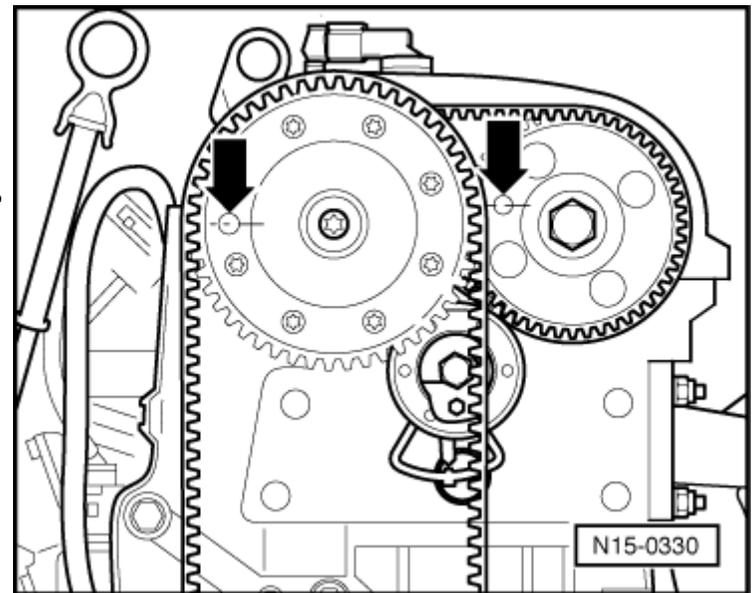

- Notch on crankshaft pulley must align with edge of marking -O-.

- The locking pin holes in the inlet camshaft sprocket with camshaft adjuster and in the exhaust camshaft sprocket must align with the corresponding holes in the camshaft housing -arrows-.

**Note**

*If the locating holes are positioned on the opposite side, the crankshaft must be turned one revolution further.*

- Lock camshafts using locking pins -T10074-:

- It should be possible to insert locking pin -A- through locking pin hole in inlet camshaft sprocket into corresponding hole in camshaft housing.
  - It should be possible to insert locking pin -B- through locking pin hole in exhaust camshaft sprocket into corresponding hole in camshaft housing.
- Remove engine mounting → Chapter.

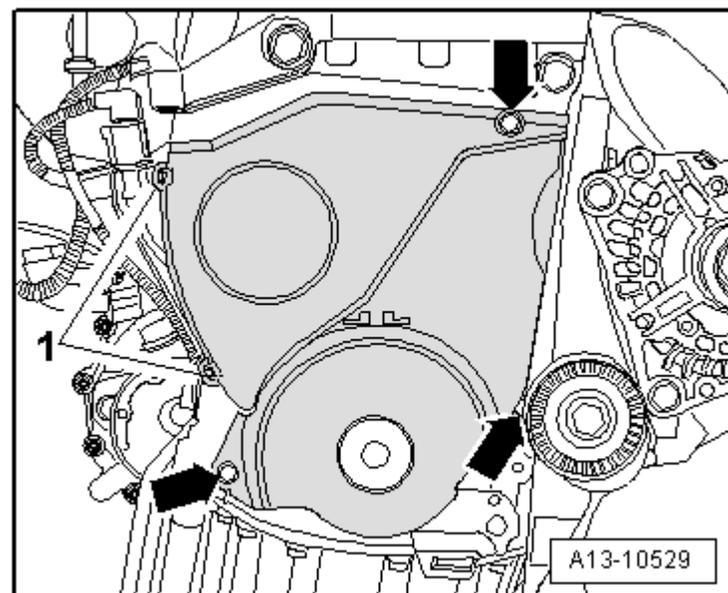

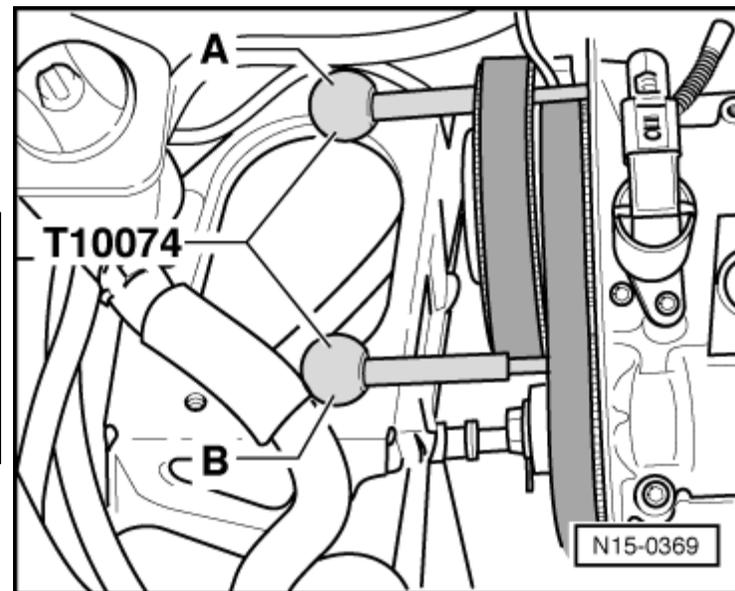

**Caution**

**Risk of damage to engine.**

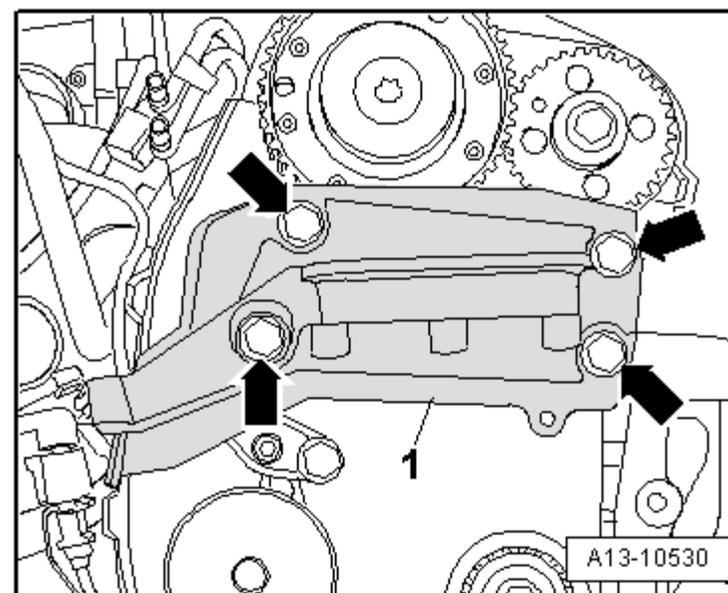

- ◆ *To prevent the crankshaft sprocket from slipping off the drive lug, do not rotate the crankshaft after the poly V-belt pulley has been detached.*
- ◆ *Secure crankshaft sprocket with bolt and 2 washers before turning crankshaft.*

- Remove poly V-belt pulley for crankshaft → Chapter.

- Remove bolts -arrows- and loosen retaining clips -1- to detach toothed belt cover (bottom).

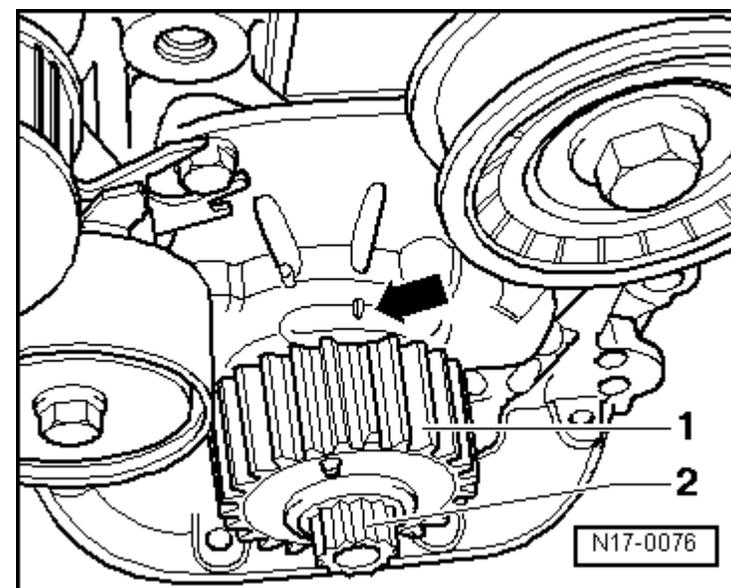

- Remove bolts -arrows- and detach engine support -1-.

- Check „TDC“ position of crankshaft:
- The flat tooth on crankshaft sprocket -1- must align with marking -arrow- on oil pump housing.

**i Note**

Disregard item -2-.

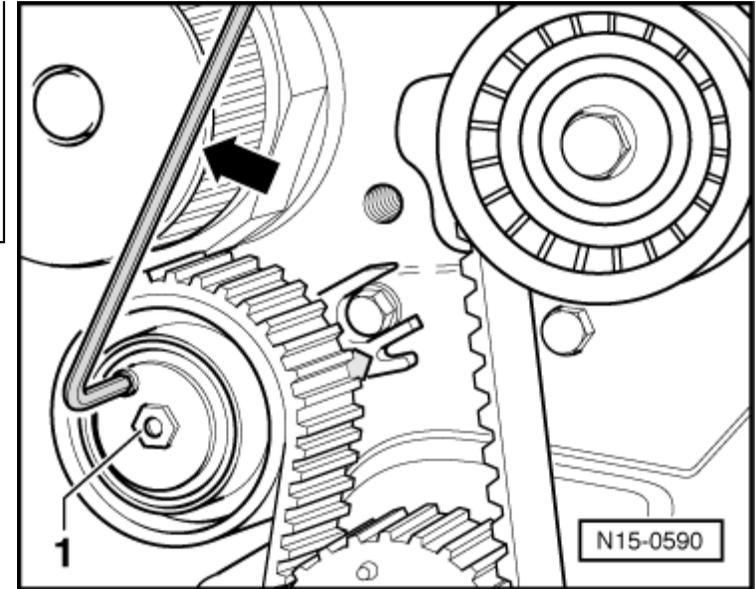

**Caution**

*If a used belt runs in the opposite direction when it is refitted, this can cause breakage.*

*Before removing, mark direction of rotation of toothed belt with chalk or felt-tipped pen for re-installation.*

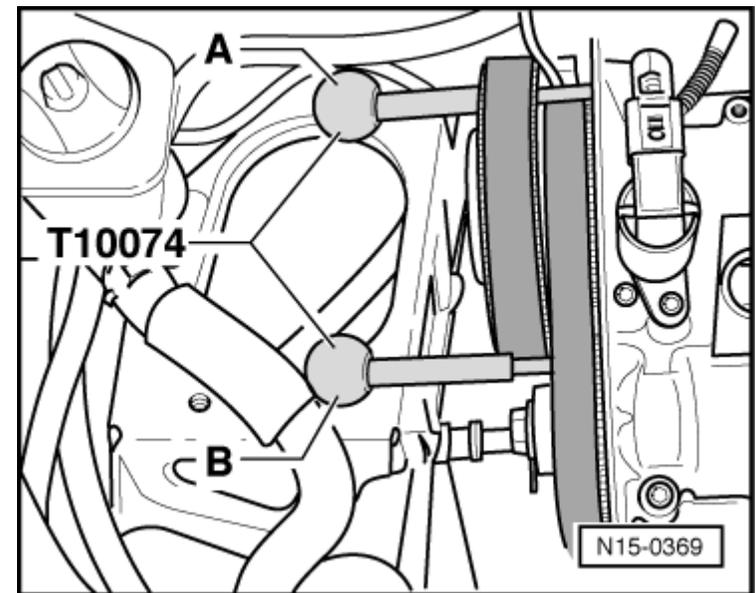

- Loosen bolt -1- for main drive tensioning roller.
- Use an Allen key to turn tensioning roller in anti-clockwise direction -arrow- and detach toothed belt.

**Installing**

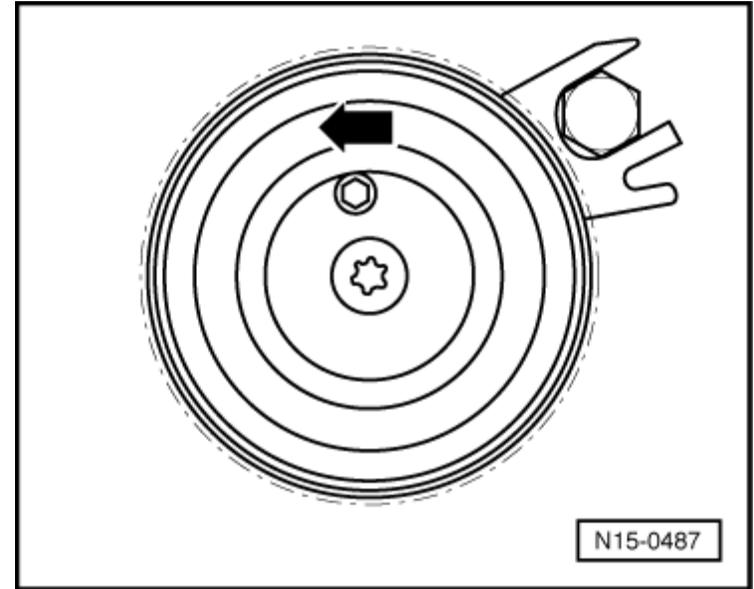

- Tightening torques → [Chapter](#)

Installation is carried out in the reverse order; note the following:

- Inlet camshaft sprocket with camshaft adjuster and exhaust camshaft are locked with locking pins -T10074-.

- Install tensioning roller for main drive (if removed) and turn anti-clockwise to position shown -arrow- using Allen key.

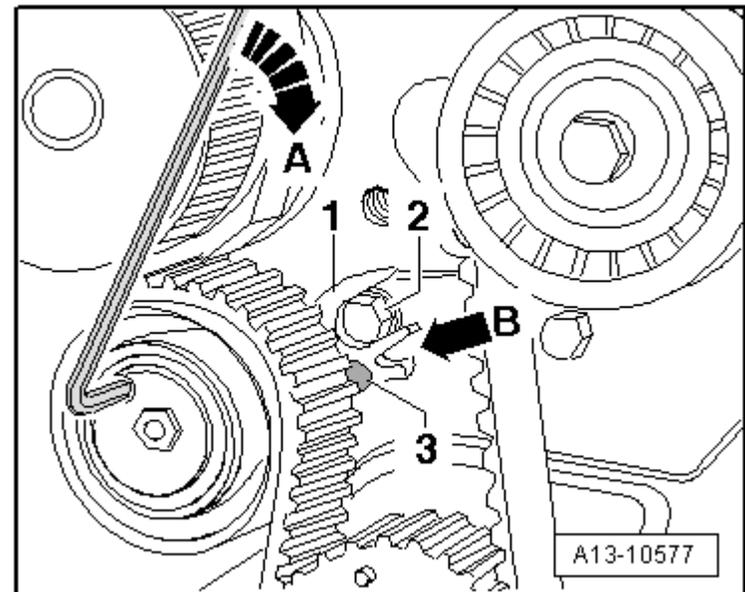

- Tighten bolt for main drive tensioning roller hand-tight.
- Bolt -2- for oil pump housing must engage in the recess in base plate -1-.

**i Note**

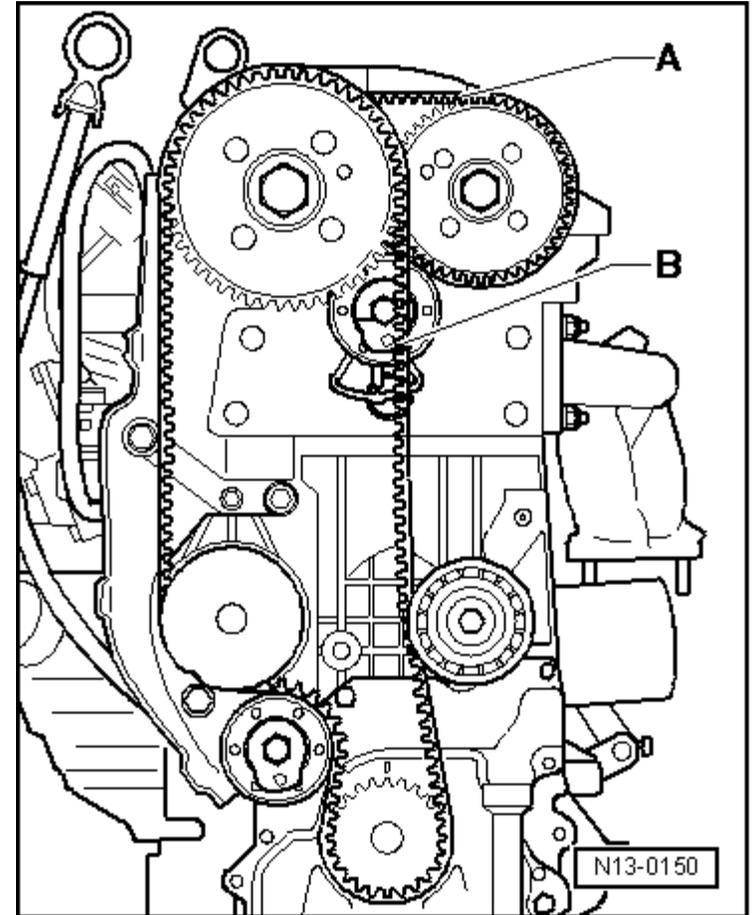

Disregard items marked -3- and -arrows-.

**i Note**

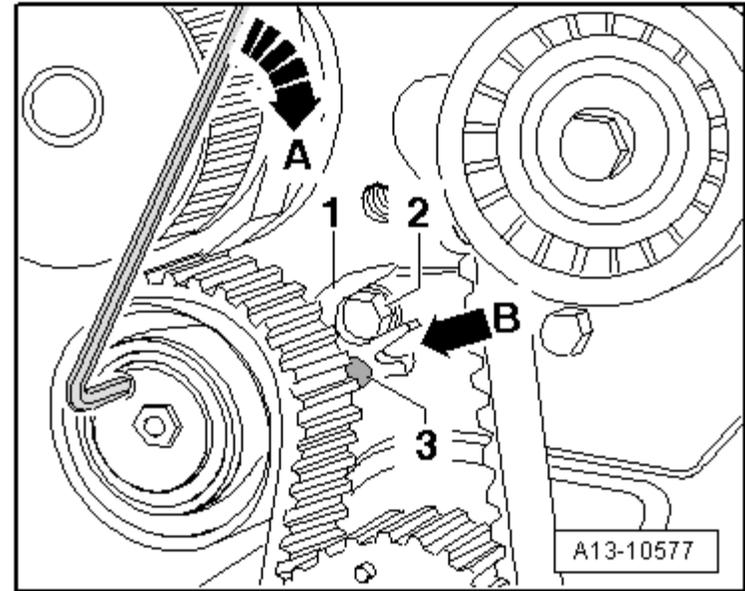

Note the marking for direction of rotation when reinstalling a used toothed belt.

- Fit main drive toothed belt -B- in the sequence coolant pump, tensioning roller, crankshaft and inlet camshaft.
- A - Coupling drive toothed belt

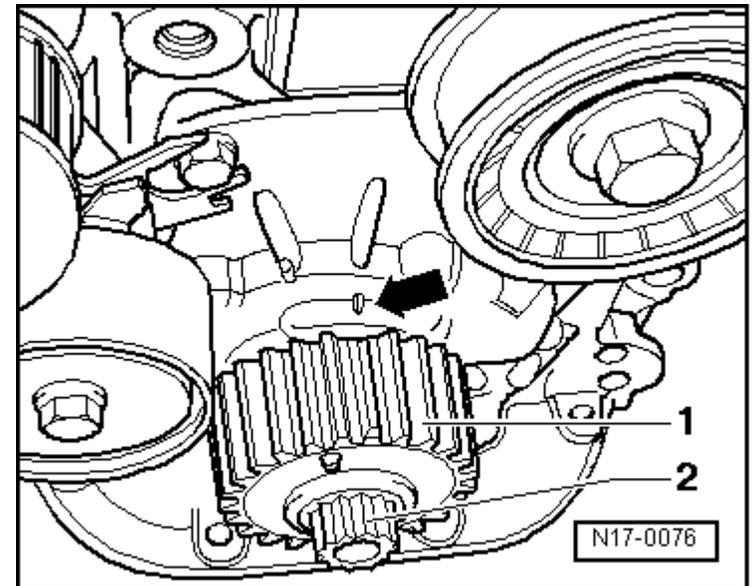

- To tension toothed belt, turn tensioning roller in clockwise direction -arrow A- until indicator -3- aligns with notch -arrow B- in base plate -1-.
- Tighten bolt for main drive tensioning roller.
- Remove locking pins -T10074-.
- Turn crankshaft 2 revolutions in direction of engine rotation and set to „TDC“ once again.

- Check „TDC“ position of crankshaft:
- The flat tooth on crankshaft sprocket -1- must align with marking -arrow- on oil pump housing.

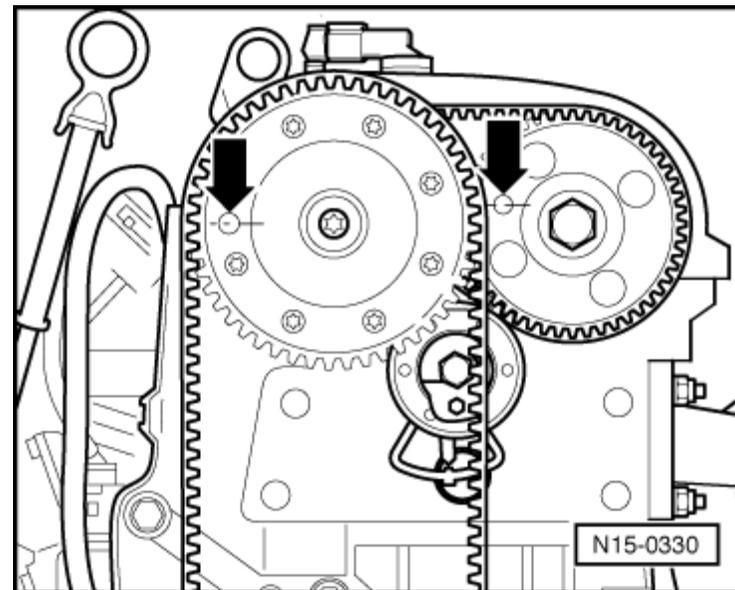

**i Note**

Disregard item -2-.

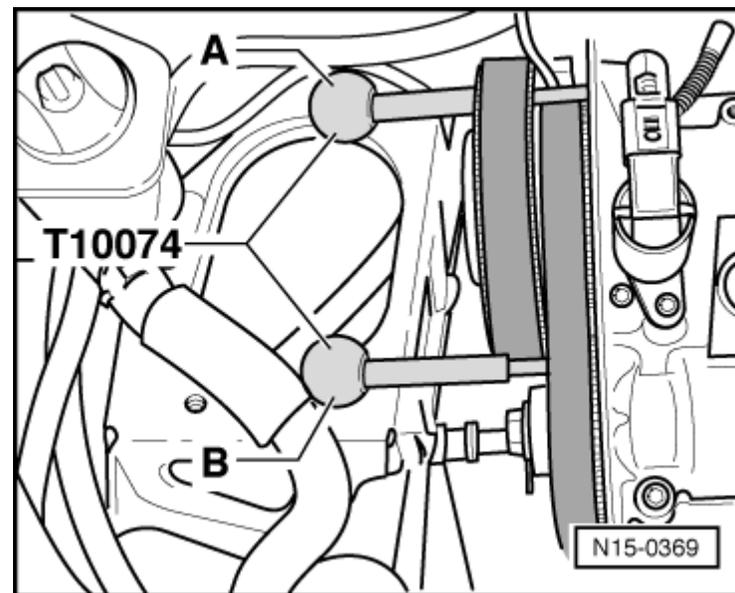

- The locking pin holes in the inlet camshaft sprocket with camshaft adjuster and in the

exhaust camshaft sprocket must align with the corresponding holes in the camshaft housing -arrows-.

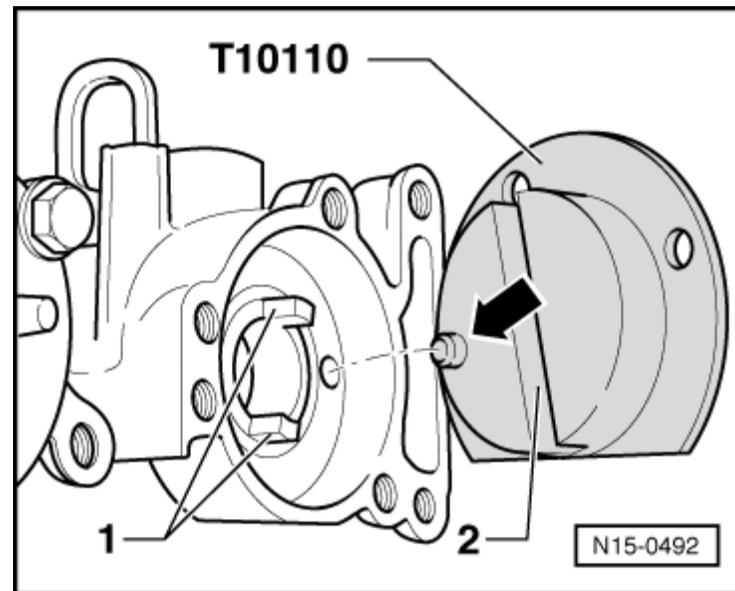

- Lock camshafts using locking pins -T10074-:
- It should be possible to insert locking pin -A- through locking pin hole in inlet camshaft sprocket into corresponding hole in camshaft housing.
- It should be possible to insert locking pin -B- through locking pin hole in exhaust camshaft sprocket into corresponding hole in camshaft housing.

- Attach locating flange -T10110- to camshaft housing of inlet camshaft working from side facing gearbox as follows:

- The pin -arrow- on the locating flange -T10110- must engage in the small hole on the axial bearing of the inlet camshaft.
- The lugs -1- on the inlet camshaft must engage in the slot -2- in the locating flange -T10110-.

- Turn inlet camshaft at hexagon of locating flange -T10110- in opposite direction of engine rotation as far as stop and hold in position.
- If the valve timing is correct, the holes -arrows- in the locating flange -T10110- must align with the tapped holes in the camshaft housing.
- Repeat adjustment procedure if holes do not align → **Anchor**.

Remaining installation steps are carried out in reverse sequence; note the following:

- Install engine support and engine mounting → **Chapter**.
- Install poly V-belt pulley for crankshaft → **Chapter**.
